Efetomeh Emma-Egoro

career@efetomeh1a.simplelogin.com • efetomeh.me

I'm Efetomeh—my name means "Wealth has reached me." As a Software Architect, I transform abstract ideas into fully functional, production-ready, purpose-driven, user-centered software efficiently and reliably by merging creative strategic planning with AI-driven automation.

What sets me apart is my critical-thinking mindset. I constantly question assumptions, weigh trade-offs, and spot hidden risks before they turn into problems. This habit helps me catch design flaws early, select the most effective tools, and create solutions that balance performance, security, scalability, and maintainability.

Experience

2024 – PRESENT
Science Teacher – Researcher | - | Hybrid

My work after graduation involved teaching science, which inspired a research project (pre-master's/pre-doctoral) focused on bridging the gap between memorizing facts and truly understanding them. By pulling together ideas from cognitive science, neuroscience, and psychology, I'm building an assessment system that can "peek" into how students think. Leveraging modern technology, the system moves past simple right-or-wrong scores to uncover the reasoning steps students take, highlight genuine critical-thinking skills, and assign grades that are backed by evidence and comparable across learners—bringing Albert Einstein's vision of education as "training the mind to think" to life.

SEPTEMBER 2024 – JANUARY 2025
Technical Support Volunteer | YouVersion | Remote

Tested, confirmed, and recorded bugs reported by mobile and desktop users so developers could fix them accurately. Delivered fast technical support, answering user questions and troubleshooting problems efficiently.

JANUARY 2023 – OCTOBER 2023
Undergraduate Researcher | Federal University Lokoja | Nigeria

Created and fine-tuned training algorithms for a deep-learning model that summarizes text, adjusting pre-trained networks to boost ROUGE scores by about 15 %. Conducted thorough evaluations that enhanced both the accuracy and speed of the automated summarization system.

JANUARY 2022 – AUGUST 2022
Technical Service Intern | Galaxy Backbone PLC | FCT, Nigeria

I kept an eye on both Wi-Fi and wired networks to maintain steady uptime and performance, and teamed up with the fiber-optic crew to locate and repair bad fiber cables, which helped cut down downtime.

Skills

Critical thinking • Problem solving • Collaboration • Excellent time management skills

Education

OCTOBER 2023
Bachelor of Science Computer Science | Federal University Lokoja | Nigeria
DeepLearning.AI TensorFlow Developer | Coursera
Deep Learning Specialization | Coursera
Python Data Structures | Coursera

Projects

Mikra is an app that lets anyone study the Bible in its original languages—Hebrew, Aramaic, and Greek. It offers side-by-side (interlinear) views, root-word lookup, and extensive cross-references, all usable offline. The app doesn't retain any settings between sessions, and every note, highlight, and group discussion is secured with end-to-end encryption. By eliminating institutional gate-keeping and corporate tracking, Mikra gives everyone the same scholarly tools used by professional theologians, while feeling as familiar and trustworthy as a physical Bible.

SCRIPS is an offline-first, single-page school-management app. It lets schools handle student profiles, flexible grading, attendance, and report generation, with all data encrypted locally on each device. Syncing is done via a remote Git repository—schools can host their own repo or use the private Git service we provide. This Git-based workflow gives administrators version control, instant rollbacks, and collaborative editing without ever exposing raw records to a central server. Because the app works offline, teachers can keep teaching even when the internet drops, and encrypted changes automatically sync once connectivity returns.
