Efetomeh Emma-Egoro

career@efetomeh1a.simplelogin.com •

I'm Efetomeh—my name means "Wealth has reached me." I serve as a Critical Analyst at the intersection of technology and strategy, where I deconstruct abstract ideas to build reliable, user-centered systems.

My core strength lies in my disciplined critical-thinking mindset: I constantly question assumptions, weigh tradeoffs, and spot hidden risks before they turn into problems. This habit helps me catch design flaws early, select the most effective tools, and create solutions that balance performance, security, scalability, and maintainability.

Experience

2025 – PRESENT
Masters' Scholar – Landmark University | - |

Researching an assessment system that can "peek" into how students think. Leveraging modern technology, the system moves past simple right-or-wrong scores to uncover the reasoning steps students take, highlight genuine critical-thinking skills, and assign grades that are backed by evidence and comparable across learners—bringing Albert Einstein's vision of education as "training the mind to think" to life.

2024 – 2025
Science Teacher – Software Architect | - | Hybrid

My work after graduation involved teaching science and solving technology-related problems. A situation at the institution I worked at inspired a project. By pulling together ideas from fine-tuning deep neural networks to utilizing trained neural nets to automate tasks, I started the project, called SCRIPS. SCRIPS began as a simple idea: make school management feel natural for faith communities—private, decentralized, and values-aligned. No centralized platforms. No data compromises. Just comprehensive record-keeping, assessment tools, and progress tracking that respects community independence.

Building SCRIPS with Nextjs and typescript while prioritizing functionality and keeping interactions responsive, I focused on:
Privacy-focused IDs: unique identifiers that protect student privacy while enabling comprehensive tracking.
Offline-first architecture: complete functionality without internet dependency using Indexed DB.
Decentralized storage: Git-based backend structure for complete data independence and version control.

From scratch within six months (leveraging my background in neural nets) and built solely (with Christ help as I did not have volunteer human help at the time), a responsive production-ready product was delivered.

SEPTEMBER 2024 – JANUARY 2025
Technical Support Volunteer | YouVersion | Remote

Tested, confirmed, and recorded bugs reported by mobile and desktop users so developers could fix them accurately. Delivered fast technical support, answering user questions and troubleshooting problems efficiently.

JANUARY 2023 – OCTOBER 2023

Undergraduate Researcher | Federal University Lokoja | Nigeria

Created and fine-tuned training algorithms for a deep-learning model that summarizes text, adjusting pre-trained networks to boost ROUGE scores by about 15 %. Conducted thorough evaluations that enhanced both the accuracy and speed of the automated summarization system.

JANUARY 2022 – AUGUST 2022

Technical Service Intern | Galaxy Backbone PLC | FCT, Nigeria

I monitored Wi-Fi and wired networks to maintain steady uptime and performance and teamed up with the fiber-optic crew to locate and repair bad fiber cables, which helped cut down downtime.

Skills

Critical thinking • Problem solving • Collaboration • Excellent time management skills

Education

OCTOBER 2023

Bachelor of Science Computer Science | Federal University Lokoja | Nigeria

DeepLearning.AI TensorFlow Developer | Coursera

Deep Learning Specialization | Coursera

Python Data Structures | Coursera

Projects

MIKRA (Try Mikra) began as a simple idea: make deep Bible study feel natural on the web—fast, readable, and distraction-free. No clutter. No sign-in wall. Just clean typography, useful navigation, and performance that respects attention.
Building Mikra, I focused on:

- Building with Nextjs and typescript for predictable and scalable foundation.
- Minimal client-side overload: render what matters and keep interactions snappy.
- Decentralized architecture: privacy-focused services and decentralized architecture so no single entity controls access.
- Content-first reading: generous spacing, careful typography, and a calm palette.
- Offline-first experience: works reliably when the network is slow or unavailable.
- Fast navigation: quick jumps between books/chapters without losing context.
- Progressive enhancement: modern features without breaking the basics.

Building Mikra, I learned:

- Typography matters more than we think—small choices compound into real focus gains.
- Offline-first is about intent as much as tooling: be explicit about what must work without a network.
- Remove features ruthlessly; every visible control competes with the text.

SCRIPS began as a simple idea: make school management feel natural for faith communities—private, decentralized, and values-aligned. No centralized platforms. No data compromises. Just comprehensive record-keeping, assessment tools, and progress tracking that respects community independence.
Building SCRIPS, I focused on:

- Building with Nextjs and typescript for reliable and scalable educational management.
- Minimal client-side overload: prioritize functionality and keep interactions responsive.
- Decentralized architecture: no centralized servers or external dependencies as communities should maintain full control.
- Privacy-preserving identification: unique student IDs that protect sensitive information while enabling robust record-keeping.
- Offline-first architecture: complete functionality without internet dependency using IndexedDB.
- Decentralized storage: Git-based backend structure for complete data independence and version control.

Building SCRIPS, I learned:

- Privacy matters more than convenience as decentralized design requires careful planning but preserves community autonomy.
- Offline-first is about intent and reliability as much as tooling and technology: be explicit about what must work without a network.
- Community trust builds slowly and transparency in data practices is essential for faith-based adoption.

Activities
